                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to treating disorders associated with radical comprisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia, and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                                                                                                                                                                Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappaconotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; NSA.

The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular analogue of the invention
membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; D13A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-

depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-pVIIA) peptide or its analogue, derivative or physiologically active salt. The conotoxins are used for treating disorders associated with channel, especially cardiac lacohaemia, cerebral ischaemia, coular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presen sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting,
                                                                                                                                                                                                                                                                                                                                           Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence;
salt. The conotoxing are used for treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia and asthma. The present sequence is a kappa-conotoxin PVIIA
                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a mammal comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           related conctoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, cornary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-
                                                                   Gaps

Purple come snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischaemic heart disease; cerebral ischaemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to kappa-PVIIA-related conotoxins and their use as protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the ireatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral cerebral scheemia, coronary artery bypass graft (CABG) surgery, ischaemic, each and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a mammal comprises

The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hyperension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (GABG) surgery, sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                               Protection and preservation of an organ \mathbf{e}.\mathbf{g}. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to kappa-PVIIA-related conotoxins and their use as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       organ protectants. The invertion also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral escapana, coronary artery bypass graft (cAsG) surgery, ischemmia, coronary artery bypass graft (cAsG) surgery, ischemmic heart disease, asthma and congestive heart failure. The presensequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Purple cone snail; kappa-conotoxin PVIIA analogue; circulatory; cardioactive; antiasthmatic; KATP channel activation; cardiac ischaemia; cerebral ischaemia; ocular ischaemia; asthma; H11A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, protecting or preserving somatic cells. The invention is for the treatment of arrhythmia, urinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, peripheral circulation disturbances, hypertension, angina, cerebral vasospasm accompanying subarachnoid haemorrhage, anxiety disorder, cerebral ischaemia, coronary artery bypass graft (CABG) surgery, ischaemic heart disease, asthma and congestive heart failure. The present sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                             Purple cone snail; kappa-PVIIA-related conotoxin; urinary incontinence; ischemic heart diseaes; cerebral ischemia; anxiety disorder; diabetes; organ protectant; arrhythmia; reperfusion injury; hypertension; angina; retinopathy; coronary artery bypass graft surgery; acute heart failure; congestive heart failure; neuropathy; nephropathy; CABG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protection and preservation of an organ e.g. heart of a mammal comprises use of a compound binding to kappa-PVIIA-binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to kappa-PVIIA-related conotoxins and their use as organ protectants. The invention also relates to a method of arresting, protecting and/or preserving an organ of a mammal using kappa-PVIIA-related conotoxins. The conotoxins can also be used for arresting, treatment of arrhythmia, utinary incontinence, reperfusion injury, diabetes, retinopathy, neuropathy, nephropathy, acute heart failure, vasospassa accompanying subarachnoid haemorrhage, anxiety disorder, oerebral ischaemia, coronary artery bypass graft (GABG) surgery, sequence is Conus purpurascens (purple cone snail) kappa PVIIA analogue
                                                                                                                                                                                                                                                                                                                                                                                                               Protection and preservation of an organ e.g. heart of use of a compound binding to kappa-PVIIA-binding site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to treating disorders associated with radical depolarisation of excitable membrane by activating a KATP channel comprising administering to an individual a kappa-conotoxin PVIIA (kappa-PVIIA) peptide or its analogue, derivative or physiologically active radical depolarisation of excitable membrane by activations are used for treating disorders associated with channel, especially cardiac ischaemia, cerebral ischaemia, ocular ischaemia, and asthma. The present sequence is a kappa-conotoxin PVIIA analogue of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating disorders associated with radical depolarization of excitable membrane e.g. cardiac, cerebral and ocular ischemia and asthma comprises activating a KATP channel by administering to an individual a kappa-conotoxin PVIIA peptide.

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiniflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipicity antimigraine, antidiabetic, tranquiliser, vulnerary, antipicity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated vith epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antinflammatory; antingaraine; antidabelic; tranquillaer; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; sulfocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder; psychosis; anxiety; schizophrenia.
                                                                                                                                                                                                                                                                                                            New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory activity of voltage gated ion channels. They may be used for treating or preventing disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffecation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, amxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96595-ABB96697 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                      New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Omega conopeptide; OCT; analgesia; inhibition; voltage-gated; calcium channel; neurone; contraction; guinea pig; ileum; WVIA; binding site; toxin; marine; snail; Conus; opiod; chronic pain; narcotics.

The sequences given in AAR19608-30 are omega conopeptides (OCTS) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTS inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT WNIA binding sites present in neuronal tissue. OCTS are components of peptide toxins derived from marine snails of the genus Conus, and act as calcium channel blockers. These OCTS may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. The C-terminal is amidated. Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24 hr after onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (OCT) WVIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the MVIA site to that for the MVIC site. (I) is come of the OCTS MVIA. MVIB. (VIA, GVIA) or RVIA or it is the cpd. SNX-C 207. (I) is esp. used to reduce neuronal damage caused by stroke. By within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage is achieved. (I) is admin. e.g. by intracerebroventricular (ICV) in achieved. (I) is admin. e.g. by intracerebroventricular (ICV) in achieved in action at 0.1-20 microg/kg, but can also be given iv. (opt. after treatment with antihistanines to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins control tissue and (2) selective inhibition of N-type voltage-gated ca currents in neuronal tissue and (2) selective inhibition of N-channel mediated controxins concorning the concorning to reverse and the specified conocoxins concopeptides are given in AAR37752-62. Several analog omega-conopeptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                   ð
                                                                                                                                                                                                                                                             AAW19555-W19572 are omega conopeptides (OCB) derived from natural peptides from Conus sp. (cone snails). The peptides and their analogues are used as analgesides acting by blocking N+Type voltage-sensitive calcium channels. The OCB can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone degenerative diseases, AIDS, reflex sympathetic dystrophy, herpes coster neuropathy, diabetic neuropathy, hyperesthesia, allodynia or hyperalgesia. The OCB are preferably administered in a medicament via an epidural route in a continuous infusion or sustained release formulation. The OCB can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to effective analgesic doses using intrachecal administration. OC cormulations comprising an OC and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged treatment methods and long-term storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                         Stable omega conopeptide compositions - for producing analgesia and for inhibiting progression of neuropathic pain disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affanity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treatment of inflammation, comprises administration of omega-conopeptide - effective to block voltage-gated calcium channels, bind with high affinity to omega-conopeptide binding site, and inhibit neuro-transmitter
                                                                                                                                                                        The present peptide is an omega conopeptide, useful as an analgesic, especially for treating neuropathic pain. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. Sequences AAM95574-589 represent sequences of analog omega-conopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electivally stimulated contraction of guinea pig ileum and (b) selectively binding to omega conopeptide WNIAA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conocoxing MVIAA and TVIA. The method is used for treating chronic pain, especially neuropathic pain Production of analgesia in mammal - by administration of omega cono-Disclosure; Fig 2A-B; 59pp; English. peptide(s)

Gohil KC; Miljanich GP, Valentino KL, Justice A, Singh T, WPI; 2000-038270/03 Measuring the activity of test compounds in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norephrene (noradrenaline) release for treating inflammation.

Disclosure; Fig 2; 47pp; English.

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega compound in blocking voltage-gated calcium channels, binding to the omega release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia an amemalian subject with chronic or intractable opiold analgesia genes of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is an omega-conopeptide analogue. Omega-conopeptides are components of peptide toxins produced marine snails of the genus conus. Omega-conopeptides and their derivatives act as calcium channel blockers and may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as WVIAA are effective as therapeutic agents for treating neurogenic conditions such as echizophrenia, tardive dyskinesia and acute dystonic reactions,
                                                                                                                                                                          Marine snail; omega-conopeptide; calcium channel blocker; SNX-202; toxin; matalgesic; antiinflammactory; anticonvulsant; neuroleptic; norepinephrine release inhibitor; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.

Omega-conopeptides are components of peptide toxins which act as voltage-gated calcium channel inhibitors. The peptides are used to enhance the enalgesic effect produced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is able to inhibit electrically stimulated contraction of the guinea pig lleum and bind to omega-conopeptide MVIIA binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect produced by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing neuronal damage related to an ischemic condition in mammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Omega-conopeptide; voltage-gated calcium channel inhibitor; analgesic; peptide toxin; opiate; pain; neurónal damage; ischemic condition; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig ilium and binds to omega-conopeptide MVIIA binding sites in neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Shon K; Garrett JE, Matkins M, Cartier GE; Mcintosh JM, Jones RM, Olivera BM, Jacobsen R,

WPI; 2002-257318/30. N-PSDB; ABL98938. New omega-conopeptides useful for treating disorders associated with voltege gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.

Claim 1(c); Page 62; 195pp; English.

The invention relates to isolated omega-conopeptides, nucleic acid
sequences encoding them, and propeptide sequences. The activity of the
peptides of the invention may be described as, analgesic, anticonvulsant,
vasotropic, cardiant, neuroprotective, creebroprotective, cardiovascular,
antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary,
antipythotic, anxiolytic and neuroleptic. Peptides of the invention act
by modulating the activity of voltage gated in channels. They may be
used for treating or preventing disorders, e.g. seizure (associated
not papiepsy), neurotoxic injury associated with conditions of hypoxia,
on channels such as neurological disorders, e.g. seizure (associated
nota, ischaemia, stroke, cerebrovascular accident, brain or spinal
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
They may also be used for treating psychiatric disorders e.g. psychosis,
anxiety or schizophremia. The analgesic agents of the invention show
diminished side effects and toxicity, and are non-addictive. The

                                                                                                                                 ò
                                                                                                                                                                                                                                      The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as analogesic, anticonvulsant, vasorropic, cardiant, neuroprotective, creatoropic cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels such as neurological disorders, e.g. seizure (associated ion channels arokai, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders.

They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The

These OCTs inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in neuronal tissue. OCTs are components of peptide toxins derived from marine snalls of the genus Conus, and act as calcium channel blockers. These OCTs may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. (Updated on 25-MAR-2003 to correct
given in records ABB96595-ABB96697 represent omega-conopeptide

Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24

hr after onset of ischaemia, of a cpd. (I) which binds selectively to an comega-conotoxin (OCT) MVIIA site in neuronal tissue. (I) has selectivity at least 100 expressed as ratio of binding affinity for the MVIIA site to comega-conotoxin; (OCT) MVIIA site in neuronal affinity for the MVIIA, GVIIA (COT) MVIIA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare compare compare redn. in neuronal damage is achieved. (I) is admin. e.g. by creater redn. in neuronal damage is achieved. (I) is admin. e.g. by contracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also intracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also compare specified conotoxins for (I). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-type volteage. Compared neuronal tissue and (2) selective inhibition of N-type volteage. Comman mediated neuroral tissue and (2) selective inhibition of N-type volteage. Compared neuronal tissue and (2) selective inhibition of N-type volteage. Compared neuronal tissue and (2) selective inhibition of N-type volteage. Compared neuronal tissue and (2) selective inhibition of N-type volteage. Compared conopeptides are given in AAR37752-62. Several analog correct PN field.)

AAW19544-W19553 are naturally occurring omega conopeptides (OCS) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analgesics acting by blocking N-type voltage-sensitive calcium channels. The OCS can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone e.g. insult to the spinal cord or peripheral nerves, cancer, bone charped diseases, AIDS, reflex sympathetic dystrophy, herpes zoster neuropathy, diabetic neuropathy, hyperesthesia, allodynia or or peripheral reversity and an edicament via an optimious infusion or sustained release formulation. The OCS can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to comparable doses using intrathecal administration. OC formulations comprising an OC and a carboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged converse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò

                                                                                                                                                                                                                                                                                                                                                                      The present peptide is an omega conopeptide, useful as an analgesic, especially for treating neuropathic pain. The peptide, which can be prepared by solid phase synthesis, can also be used to inhibit neuronal damage and treat schizophrenia, tardive dyskinesia, acute dystonic reactions, inflammation and epilepsy. subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site, and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat forther analgesia especially in subjects experienting neuropathic pain; and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS
                                                                                                                                                                                                                                                                                                                                                                                          Treatment of inflammation, comprises administration of omega-conopeptide - effective to block voltage-gated calcium channels, bind with high affinity to omega-conopeptide binding site, and inhibit neuro-transmitter

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) for treating inflammation. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia in a mammalian subject with chronic or intractable pain. Analgesia caused by selected compounds may reduce the reliance on opioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Marine snail; omega-conopeptide; calcium channel blocker; SVIB; SNX-183; toxin; analgesic; antiinflammatory; anticonvulsant; neuroleptic; norepinephrine release inhibitor; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation; epilepsy.
                                   Measuring the activity of test compounds in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Justice A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                              Sequences AAM95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide of guinea pig ileum and (b) selectively binding to omega conopeptide of guinea pig ileum and (b) selectively binding to omega conopeptide will binding sites in neuronal tissus, where these activities are within the ranges of those of omega-conotoxins MVIA and TVIA. The method is used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Omega conopeptide; analgesic; nociceptive; neuropathic; pain; conotoxin; matine snail; peptide toxin; inflammation; binding; voltage-gated calcium channel; inhibition; norepinephrine; noradrenaline; anti-inflammatory.

                                                                                             The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrenia, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a teactive group (III) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a
                        Selecting a compound for producing analgesia involves measuring activity of test compound in blocking voltage-gated calcium channels, binding to omega conopeptide binding site and inhibiting norepinephrine release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity.
                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

ö
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in peptides are not reatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Omega-conopeptide, voltage-gated calcium channel inhibitor, analgesic, peptide toxin; opiate; pain; neuronal damage; ischemic condition; schizophrenia; tardive dyskinesia; acute dystonic reaction; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enhancing analgesia produced by opiates by administering an omega-
conopeptide that inhibits electrically stimulated contraction of guinea
pig illum and binds to omega-conopeptide MVIIA binding sites in neuronal
tissues.

The present sequence represents an omega-conopeptide. Omega-conopeptides channel inhibitors. The peptides are used to enhance the analgesic effect broduced by an opiate in a mammalian subject. The method comprises administering to the subject an omega-conopeptide which is abbe to bind to omega-conopeptide MITA binding sites present in neuronal tissue. Omega-conopeptides are useful for enhancing the analgesic effect by an opiate. Omega-conopeptides may also be used in the treatment of pain, in reducing neuronal damage related to an ischemic condition in dammals, and in treating schizophrenia, tardive dyskinesia and acute dystonic reactions, inflammation and epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises peptides having calcium channel blocking activities which are derived from the venomous saliva of assassin bugs. The calcium channel blocking peptides of the invention are useful for treating stenocardia, hypertension, myocarditis, arrhythmia and cerebral ischaemia. The present amino acid sequence represents a cone snail wcondtoxin peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cone snail; venomous saliva; calcium channel blocking activity;

Omega-conopeptide P6.3 toxin sequence.

(first entry)

12-JUL-2002

ABB96876;

```
The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propebtide sequences. The activity of the periods of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antipleychotic, anxiolytic and neuroleptic. Peptides of the invention act of modulating the activity of voltage gated in channels. They may be used for treating or preventing disorders associated with voltage gated in channels and as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal events; pain e.g. migraine; inflammation or acrdiovascular disorders.

They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show and element and events in the analgesic agents of the invention show and element and events and exects and encodictive. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Shon K;

```

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antinifisammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipaychotic, anxiolytic and neurolegic. peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated vith epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal anoxia, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schlzophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96595-ABB96697 represent omega-conopeptide

Sequence 72 AA;

propeptide sequences

sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgasic, anticonvulsant, vasotropic, cardiant, neuroprotective, creebroprotective, cardialsant, antiinflammatory, antimigraine, antidabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hyposlycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders.

The invention relates to isolated omega-conopeptides, nucleic acid

antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act used wouldating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated anoxia, ischeemia, stroke, cerebrovascular accident, brain or spinal events; pain e.g. migraine; inflammation perinatal asphyxia or hypoglycaemic rhey may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences

The invention relates to isolated omega-conopeptides, nucleic acid
sequences encoding them, and propeptide sequences. The activity of the
peptides of the invention may be described as, analgesic, anticonvulsant,
vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular,
antiinflammatory, antimigatahe, antidiabetic, tranquiliser, vulnerary,
antiphychotic, anxiolytic and neuroleptic. Peptides of the invention act
by modulating the activity of voltage gated ion channels: They may be
used for treating or preventing disorders associated with voltage gated
ion channels such as neurological disorders, e.g. seizure (associated
with epilepsy), neurocoxic injury associated with conditions of hypoxia,
anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
cevents; pain e.g. migraine; inflammation or cardiovascular disorders.
They may also be used for treating psychiatric disorders e.g. psychosis,
anxiety or schizophrenia. The analgesic agents of the invention show
diminished side effects and toxicity, and are non-addictive. The
sequences given in records ABB96698-ABB96806 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimpraine; antidabetic; tranquiliser; vulnerary; antipsychotic; antiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; migralne; inflammation; cardiovascular disorder; psychiatric disorder; psychosis; anxiety; schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

equences encoding them, and properties equences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiavascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders seasociated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischemaia, erroke, cerebrovascular accident, brain or spinal chord trauma, drowning, sulffocation, perinatal asphyxia or hypoglycamic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquiliser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; sulfocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder;
                                                                                                                                      New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, by modulating the activity of voltage gated in channels. They may be used for treating or preventing disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, isolaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic they may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96807-ABB96905 represent omega-conopeptide
                                                                                                                           New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.
                                                                                                                                                                                 Claim 1(a); Page 71; 195pp; English.

```
The invention relates to isolated owega-conopeptides, nucleic acid
sequences encoding them, and propeptide sequences. The activity of the
peptides of the invention may be described as, analgesic, anticonvulsant,
vasotropic, cardiant, neuroprotective, cerebroprotective, cardiavascular,
antinflammatory, antimigrathe, antidiabelic, tranquiliser, vulnerary,
antiphyshotic, anxiolytic and neuroleptic. Peptides of the invention act
conting the activity of voltage gated ion channels. They may be
used for treating or preventing disorders associated with voltage gated
to no hannels such as neurological disorders, e.g. seizure (associated
of the pilepsy, neurocoxic injury associated with conditions of hypoxia,
anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic
chord trauma, drowning, inflammation or cardiovascular disorders.
They may also be used for treating psychiatric disorders enviety or schizophrenia. The analgesic agents of the invention show
sequences given in records ABB96697 represent omega-conopeptide
nrowshirias amminines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä
                                                                                                                                                                                                                                   New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or

                                                                                                                                                                                                                               7
                                                                                                                     This sequence represents a tyrosinase inhibitor peptide which was isolated from the pupae of house flies. The peptide has a high inhibitory activity on tyrosinase, which catalyses biological production of melanin pigment, and is stable at ambient pH. The peptide can be used for dermal medicines, cosmetics, food preservatives and insecticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pure I-conotoxin peptides isolated from venom of cone snails, useful for
the regulation of the flow of potassium through potassium channels in the
treatment of e.g. multiple sclerosis.

The present invention describes substantially pure 1-conocorn perpetute invention describes substantially pure 1-conocorn perpetute invention describes substant, antidabetic, antiaddictive, cardatar, antidabetic, antidabetic, antidaddictive, cardatar, antidabetic, antidaddictive, cardatar, antidabetic, antidaddictive, independent controlation, represented the cardation of antidarthritic, dermaclogical, trangulaliser and neuroleptic activities. Controlater in the treatment of multiple sclerosis, acute antegonist. (I) can be used as an H-ATPase stimulator, potasium agonist and curare antidional leukoencephalomyelitis, optic neuromyelitis, progressive antidional leukoencephalomyelitis, optic neuromyelitis, progressive multifocal leukoencephalomyelitis, adrenoleukodystrophy, acute transverse myelitis, subacute sclerosing panencephalomyelitis, metachromic leukodystrophy, Pelizaeus Merzbacher disease, spinal cord injury, leukodystrophy, Pelizaeus Merzbacher disease, spinal cord injury, cotulinum toxin poisoning, Huntington's chorea, compression and entrapment neuropathies, cardiovascular disease, reactive gliosis, hyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive chyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive chyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive chyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive chical depolarisation of excitable membranes, and disorders associated with voltage gated ion channels, pain and a neuromuscular disorder. (I) are also useful for the treatment of autoimmune disease, and cancing arthritis, systemic lupus eryhrematosus, Alzheimer's, anxiety and schizophrenia. Abisbas62 to Abisbas78 and Ablahemer's anxiety and schizophrenia. Abisbas62 to Abisbas8746 to Abisbaser invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cone snail; marine gastropod; neuroprotective; antiinflammatory; ophthalmological; antibacterial; anticonvulsant; muscular; antidiabetic; cardicvascular; antiarrhythmic; cardiant; immunosuppressive; nootropic; antiaddictive; cytostatic; cerebroprotective; antiasthmatic; vasotropic; analgesic; antimigraine; relaxant; antirheumatic; antiarthriic; dermatcological; tranquilliser; neuroleptic; H-ATPase stimulator; potassium agonist; curare antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conotoxin; Conus; I-conotoxin; I-superfamily conotoxin; venom; antidote;
                                                                                    The present invention describes substantially pure I-conotoxin peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes substantially pure I-conotoxin peptides of 30 -50 residues (I). (I) have neuroprotective, antiinflammatory, cardiovascular, antidate, antidabetic, antiadiative, muscular, cardiovascular, antidate, antidabetic, antiadiative, relaxant, antiarthritic, dermatological, tranquilliser and neuroleptic, antiarthritic, dermatological, tranquilliser and neuroleptic activities.

(I) can be used as an H-Arpaes stimulator, potassium agonist and curare disseminated encephalomyelitis, optic neuromyelitis, progressive, antificoal leukoencephalopathy, adrenolatedystrophy, acute transverse complication to the standard disseminated encephalopathy, adrenolatedystrophy, acute transverse complication, betulinum toxin poisoning, Huntington's chorea, compression and hyperglycaemia, immunosuppression, cocaine addiction, cancer, cognitive contrapment neuropathies, cardiovascular disease, reactive gliosis, dysfunction, disorders resulting from the defects of neurotranmitter colocking drugs. (I) can also be used to treat disorders associated with woltage gated ion channels, pain and a neuromuscular disorders associated with voltage gated ion channels, pain and a neuromuscular disorders. Contoxin. They are also useful for the treatment of autoimmune diseases, are also useful for the treatment of autoimmune diseases. Contoxin. They are also useful for the treatment of autoimmune diseases, and schizophrenia. Abusba662 to Abla8778 and Abbs8546 to Abbs8934

New omega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.

Example 2; Page 56; 195pp; English.

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiphylammacory, antimigrathe, antidiabetic, tranquiliser, vulnerary, antiphylammacory, antimigrathe, antidiabetic, tranquiliser, vulnerary, antiphylaming the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated in channels such as neurological disorders, e.g. seizure (associated ino channels such as neurological disorders, e.g. seizure (associated anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammacion or cardiovascular disorders.

They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show contains and toxicity, and are non-addictive. The

The sequence is a cone snail O-superfamily conotoxin propeptide. The sequence is a cone snail O-superfamily conotoxin propeptide. The sequence is a cone snail o-superfamily conotoxin propeptides are useful for regulating the flow of sodium through sodium channels in an individual and the treatment or prevention of disorders cassociated with voltage gated ion channel disorders, including associated with voltage gated ion channel disorders, including demyelinating diseases i.e. multiple sclerosis, optic neuromyelitis, defence phalomyelitis adrenoleukodystrophy, acute transverse myelitis, progressive multifocal leukoencephalomyelitis (SSPE), metachromatic leukodystrophy, colsoning huntington's, compression, entrapment neuropathies i.e. ulnar polsoning Huntington's, compression, entrapment neuropathies i.e. ulnar cardiac arrhythmias and congestive heart failure, reactive gliosis, cardiac arrhythmias and congestive heart failure, reactive gliosis, hyperglycemena, immunosuppression, cocaine addiction, cancer, cognitive dysfunction, neurotransmitter disorders (i.e. Eaton-Lambert syndrome) and creversal of curare and other neuromuscular blocking drugs. The neurological disorder is a seizure, preferably one associated with ceptiengy. The neurological disorder is a neurotoxic injury is associated with hypoxia, anoxia or ischaemia. The neurotoxic injury is associated with expoxia or hypoglycaemic events. The disorder is pain i.e. migraine, apphyxia or hypoglycaemic events. The disorder is pain i.e. migraine, daorder is a infilammation or a cardiovascular disorder is pain in pain or about to splice subjected to a pain causing event, and to treat disorders associated with subjected to a pain causing event, and to treat disorders associated with radical depolarisation of excitable membranes by activating a KATP channel, the disorders include cardiac, ocular and cerebral ischaemia and

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasocropic, cardiant, neuroprotective, cerebroprotective, cardiant, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia,
                                                                                                                                                                                                                               Omega-conopeptide, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquiliser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke, cerebrovascular accident; brain trauma; spinal chord trauma; stroke, suffocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .... wmega-conopeptides useful for treating disorders associated with voltage gated ion channels e.g. pain, inflammation, neurologic or cardiovascular disorders.

anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal blord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be used for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show sequences given in records ABB96698-ABB96806 represent omega-conopeptide generic toxin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAR19608-30 are omega conopeptides (OCTs) and derivatives of these, which may be used to produce analgesia in a mammal. These OCTs inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in pauronal tissue. This is shown by the peptides ability to stimulate contraction in quantonal tissue. OCTs are components of peptide toxins derived from marine snails of the genus Comus, and act as calcium channel blockers. These OCTs may be used to replace opiceds in the treatment of chronic pain or to reduce the opiced dosage required. This helps to reduce dependence on and tolerance to opiced narcotics. These OCTS inhibit voltage-gated calcium channels selectively in neuronal tissue. This is shown by the peptides ability to stimulate contraction in guinea pig ileum and to bind to OCT MVIIA binding sites present in marine snails of the genus Conus, and act as calcium channel blockers. These OCTS may be used to replace opiods in the treatment of chronic pain or to reduce the opiod dosage required. This helps to reduce dependence on and tolerance to opiod narcotics. The after onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (OCT) MVITA site in neuronal tissue. (I) has selectivity

at least 100 expressed as ratio of binding affinity for the MVITA site to that for the MVIIC site. (I) is one of the OCTS MVIIA, MVIIB, GVIAA, GVIIA

CC or RVIAA or it is the Cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare 10.5051403 where cpds. are given within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage is achieved. (I) is admin. e.g. by intracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also in blood pressure caused by (I). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-type voltage.

C dannel mediated neurotransmitter release in neuronal tissue. Primary channel mediated neurotransmitter release in neuronal tissue. Primary comega-conopeptides are given in AAR37752-62. Several analog correct PN field.)

Ischaemia-related neuronal damage in mammals is reduced by admin., 4-24

Traffer onset of ischaemia, of a cpd. (I) which binds selectively to an omega-conotoxin (oCT) WVIA site in neuronal tissue. (I) has selectivity of at least 100 expressed as ratio of binding affinity for the MVIIA site to that for the MVIIC site. (I) is one of the OCTS MVIIA, MVIIB, GVIA, GVIIA or RNA or it is the cpd. SNX-207. (I) is esp. used to reduce neuronal damage caused by stroke. By delaying admin. for some time (compare to USSO1403 where cpds. are given within 1 hr of the onset of ischaemia) a greater redn. in neuronal damage is achieved. (I) is admin. e.g. by intracerebroventricular (ICV) injection at 0.1-20 microg/kg, but can also compare to be given i.v. (opt. after treamment with antihistamines to minimise redn. in blood pressure caused by (I)). (I) is also at least as effective as the specified conotoxins for (I) selective inhibition of N-type voltage. C gated Ca currents in neuronal tissue and (2) selective inhibition of N-type voltage. C channel mediated neurotransmitter release in neuronal tissue. Primary comega-conopeptides are given in AAR37752-62. Several analog correct PN field.)

AAM19544-W19553 are naturally occurring omega conopeptides (OCs) isolated from Conus sp. (cone snails). The peptides and their analogues are used as analgesics acting by blocking N-type voltage-sensitive calcium channels. The OCs can be used to treat neuropathic pain as a result of e.g. insult to the spinal cord or peripheral nerves, cancer, bone curopathy, diabetic neuropathy, hyperesthesia, allodynia or neuropathy, diabetic neuropathy, hyperesthesia, allodynia or chycalgesia. The OCs are preferably administered in a medicament via an optimuous infusion or sustained release formulation. The OCs can provide pain relief when administered epidurally in the absence of a permeation enhancer, at doses that are comparable to fective analgesic doses using intrathecal administration. OC formulations comprising an OC and acroboxylic acid buffer anti-oxidant. They also confer stability to solutions containing them for prolonged corrections in the statement methods and long-term storage. (Updated on 27-AUG-2003 to

Conus genus, marine snail; cone snail; omega-conopeptide; analgesia; cocieptivo pain; neuropathic pain; neuronal tissue; conotoxin; inflammation; schizophrenia; tardive dyskinesia; acute dystonic reaction; rheumatoid arthritis; epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  subject. The method comprises administration of an ownega-conopeptide high affective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treat produce analgesia (especially in subjects experiencing neuropathic pain); produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which exit as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS

conopeptides. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act as calcium channel blockers. The invention relates to a method of producing analgesia in a mammal that comprises administering an omega conopeptide having activities in (a) inhibiting electrically stimulated contraction of guinea pig ileum and (b) selectively binding to omega conopeptide MVIA binding sites in neuronal tissue, where these activities are within the ranges of those of omega-conotoxins MVIA and TVIA. The method is used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequences AAW95564-573 represent primary sequences of natural omega-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method has been developed for the treatment of inflammation in a subject. The method comprises administration of an omega-conopeptide effective to: (i) block voltage-gated calcium channels; (ii) bind with high affinity to an omega-conopeptide binding site; and (iii) inhibit neurotransmitter release from nervous tissue. The method is used to treatmention and associated pain. The treatment can also be used to produce analgesia (especially in subjects experiencing neuropathic pain); and to treat schizophrenia, tardive dyskinesia and acute dystonic reactions, rheumatoid arthritis, and epilepsy. The present sequence represents a natural omega-conopeptide. Omega-conopeptides are components of peptide toxins produced by marine snails of the genus Conus, and which act, as calcium channel blockers. (Updated on 27-AUG-2003 to correct OS

A method has been developed of selecting a test compound for treating inflammation. The method comprises measuring the activity of the test compound in blocking voltage-gated calcium channels, binding to the omega conopeptide binding site and inhibiting norepinephrine (noradrenaline) release from nervous tissue. The method is useful for selecting compounds for treating inflammation. The selected compounds are capable of producing analgesia in a mammalian subject with chronic or intractable pain. Analgesia caused by selected compounds may reduce the reliance on popioid analgesic agents of the prior art which cause dependency and tolerance, requiring potentially dangerous increases in opioid doses to achieve the analgesic effect. The present sequence represents an omega conopeptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Omega-conotoxin, venom, predatory marine snail, N-type calcium channel, neuronal damage reduction, ischemia, analgesia, opiate analgesia, schizophrenia, stimulant induced psychosis, hypertension, inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAM95564-573 represent primary sequences of natural omegaconopeptides. Omega-conopeptides are components of peptide toxins produced by marine snalls of the genus Conus, and which act as calcium analgesia in a mammal that comprises to a method of producing analgesia in a mammal that comprises administering an omega conopeptide of guinea pig ileum and (b) selectrically stimulated contraction of guinea pig ileum and (b) selectrically shiding to omega conopeptide WIIA binding sites in neuronal tissue, where these activities are within used for treating chronic pain, especially neuropathic pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Omega conopeptide; analgesic; nociceptive; neuropathic; pain; conotoxin; marine snail; peptide toxin; inflammation; binding; voltage-gated calcium channel; inhibition; norepinephrine; noradrenaline; anti-inflammatory.

calcium channels
```

The present sequence represents an omega-conotoxin. Omega-conotoxins are isolated from women of predatory marine snails, and have a selectivity for N-type calcium channels over P/Q type channels, and so block N-type calcium channels. The omega-conotoxins of the invention can be used in any disease or disorder where blockage of N-type calcium channels is required, e.g. in the reduction of neuronal damage following ischemia, production of analgesia, or enhancement of opiate analgesia, in the treatment of schizophrenia, stimulant induced psychoses, hypertension, inflammation, and diseases which cause bronchotension, and also in the inhibition of progression of neuropathic pain. They can also be used in screen to identify compounds with activity at N-type voltage sensitive peptides used for the treatment of disorders and diseases where Novel peptides used for the treatment of the Neguired.                                                                                   The present sequence is an omega-conopeptide from marine snails of the genus Conus. Omega-conopeptides are components of peptide toxins produced by the cone snails, and which act as calcium channel blockers. Natural omega-conopeptides and their derivatives may be useful for producing analgesia in nociceptive and neuropathic pain. The peptides bind to omega-conopeptide binding sites, which are present mainly in neuronal tissue, and inhibit norepinephrine release from nervous tissue. Conopeptides such as MVIIA and TVIA are effective as therapeutic agents for treating neurogenic conditions such as schizophrania, tardive dyskinesia and acute
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
omega conopeptide binding site and inhibiting norepinephrine release.
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                 Score 61; DB 3; Length 26;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19, Application US/08496847

Patent No. 5795864

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Bowersox, Stephen S.
APPLICANT: Adrianssens, Peter I.
APPLICANT: Adrianssens, Peter I.
APPLICANT: Adrianssens, Peter I.
APPLICANT: Kristipati, Ramssharma
TITLE OF INVENTION: FORMULATIONS FOR PREVENTING PROGRESSION OF NEUROPATHIC PAIN
NUMBER OF SEQUENCES:
ADDRESSER: Dehlinger & Absociates
APPLICANT: VALENTINO, KAREN L
APPLICANT: MILJANICH, GEORGE P
TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA AND
TITLE OF INVENTION: ENHANCING OPIATE ANALGESIA
NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS:
ADDRESSEE: Law Offices of Peter Dehlinger
STREET: 350 Cambridge Avenue, Suite 300
CITY: Palo Alto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 46.6%; Score 75; DB 1; Length 26; Best Local Similarity 42.3%; Pred. No. 0.023; Matches 11; Conservative 5; Mismatches 10; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                       CURRENT APPLICATION DATA:

SOFTWARE: Patentin Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/049,794

FILING DATE: 19930415

CLASSITCATION: 514

PRIOR APPLICATION DATA:

APPLICATION NUMBER: US 07/814,759

FILING DATE: 30-DEC-1991

ATTORNEY/AGENT INFORMATION:

NAME: Strafford, Carol A.

REGISTRATION NUMBER: 34,44

REFERENCE/DOCKET NUMBER: 5865-0009.30

TELLEPHONE: (415) 324-0860

INFORMATION FOR SEQ ID NO: 19:

                                                                                                                  Sequence 29, Application US/08496847
Patent No. 5795864
GENERAL INFORMATION:
APPLICANT: Ametuz, Gary A.
APPLICANT: Bowersox, Stephen S.
APPLICANT: Golil, Kishorchandra
APPLICANT: Ariaensens, Peter I.
APPLICANT: Kristipati, Ramasharma
TITLE OF INVENTION: METHODS AND
TITLE OF INVENTION: METHODS AND
TITLE OF INVENTION: PORMULATIONS FOR PREVENTING PROGRESSION OF NEUROPATHIC PAIN
NUMBER OF SEQUENCES: 36
CORRESPONDENCE ADDRESS:
ADDRESSEE: Deblinger & Associates
